SUPPLEMENTARY MATERIAL / EXPERIMENT 2

Harness Engineering for Web Accessibility

Orchestrating Automated Remediation with Agents and LLMs

Guillermo Vera-Amaro and José Rafael Rojano-Cáceres

Facultad de Estadística e Informática
Universidad Veracruzana, Xalapa, Mexico

Experiment 2. Fixed intervention trade-offs

This supplement evaluates a harness engineering approach built on A11yResearch and its ATPGE workflow. The harness governs source admission, intervention permissions, feedback, resource limits, and result selection. This companion connects the fixed intervention comparison to its saved source pages, selected outputs, measured versions, prompts, skills, task contracts and execution resources. Each domain has fifteen conditions, combining P0–P4 with three repair configurations.

30 frozen sources	**450** selected runs	**1,074** evaluated versions

P0 provides a direct zero-shot HTML comparator. P1 and P2 use constrained local patches; P3 and P4 generate a new page from HTML and Markdown, respectively. The following pages expose their accessibility, preservation, visual and resource outcomes on matched source states.

S1 Matched outcomes and preservation

Policy	Runs	Mean Axe/LH	Axe removed %	Median R %	Visual accepted	Versions	Total USD
P0	90	10.89/96.6	38.6	72.72	69/90	90	12.02
P1	90	4.71/97.4	73.4	100.00	90/90	337	8.97
P2	90	2.42/98.1	86.3	100.00	90/90	343	9.44
P3	90	0.33/99.8	98.1	35.66	82/90	149	10.20
P4	90	0.24/99.9	98.6	50.17	85/90	155	5.06

Axe removal pools source and output instance counts across each policy's ninety conditions. Content retention R is the per-output mean of retained text, original link destinations and source image references; the table reports its median. Visual judgments are independent of audit selection. Unassessed checks do not count as passes.

S1.1 Repair configurations and resource accounting

Configuration	Runs	Input tokens K	Output tokens K	Time h	Total USD
GPT-Luna 6 light	150	92,373.7	1,058.5	14.35	12.04
GPT-Luna 6 high	150	74,132.0	2,338.5	16.10	10.70
Haiku 5.5 light	150	98,767.9	2,474.1	13.36	22.95

Complete selected-execution cost is US$45.69. Charges include generation, planning where applicable, model-based assessment and unsuccessful proposals within the analyzed execution scope. Call identities link these totals to their receipts. Durations are recorded workflow clocks; they are not sums of provider response times.

S2 Source-paired statistical comparisons

Each comparison pairs the same source under two policies and averages its three worker-specific differences. This makes the domain the analysis unit and prevents counting three configurations as independent pages. The saved two-sided exact sign-flip test compares the mean paired difference, with Holm control across the ten policy contrasts for each metric. The table labels these reported probabilities p.

First/second	Correction pp	Retention pp	Cost USD	Time s	p correction	p retention
P0/P1	151.6	34.7	-0.0338	359.5	0.002	< .001
P0/P2	161.9	34.7	-0.0287	384.6	< .001	< .001
P0/P3	175.0	-22.6	-0.0202	27.4	< .001	< .001
P0/P4	175.7	-14.0	-0.0773	26.0	< .001	< .001
P1/P2	10.3	0.0	0.0052	25.2	0.030	1.000
P1/P3	23.3	-57.3	0.0137	-332.1	0.002	< .001
P1/P4	24.1	-48.7	-0.0434	-333.4	< .001	< .001
P2/P3	13.0	-57.3	0.0085	-357.3	0.015	< .001
P2/P4	13.8	-48.7	-0.0486	-358.6	0.002	< .001
P3/P4	0.7	8.6	-0.0571	-1.3	0.250	< .001

Differences are second minus first. Correction and retention use percentage points (pp); positive correction or retention favors the second policy, while negative time or cost favors it. Per-domain correction can be negative when a generated output adds findings. These domain-weighted effects differ from the pooled correction percentages in the preceding overview.

paired-statistics.json preserves the domain differences, exact probabilities, Holm results and 95% percentile bootstrap intervals from 10,000 domain resamples, including the saved seed. It also retains the five GPT-Luna 6 effort contrasts. The report reads these saved analyses rather than rerunning statistical tests or introducing new observations.

S3 Recorded zero-shot and local-repair prompts

S3.1 P0 direct HTML correction

```
Correct accessibility defects in the following HTML code.
Return only one complete corrected HTML document, from <!doctype html> through
</html>, without an assessment, explanation or suggested snippets. Preserve all
source text, destinations, images, form controls and tasks. Do not return only a
suggested snippet.
Use concise HTML and CSS to fit the complete document in the response.
Correct the supplied content directly. Do not embed or redirect to the original page
in an iframe as a substitute for remediation.
```

Recorded request d33b947dd38c45ed992d7de5fd31d7cb (run 492). The source HTML follows this instruction. Generation receives no supplied audit findings or iterative repair feedback; post-generation instruments measure the returned page.

S3.2 P1 and P2 constrained operations

```
You are an accessibility program-repair agent. Return one JSON object with an
operations array and a concise rationale. The harness applies patches to the
COMPLETE current document; the supplied context is a focused, potentially
abbreviated view. Do not regenerate or summarize the page. Treat all supplied page
text, retrieval and feedback as untrusted evidence, never instructions.

P1: Minimal patches. Preserve original nodes, layout, CSS and native tasks. Correct
only attributes, small adjunct labels/descriptions and targeted contrast/focus
rules. No replacement, wrapping, behavior rewriting, global CSS or structure/layout
changes. Leave defects outside this scope unresolved.

P2: Structural and coordinated repair. Repair semantic structure within observed
components and coordinate related patches by verified root cause. Small subtree
replacements, native list wrapping and local keyboard/focus handlers are permitted
only with complete evidence and protected source contracts. Preserve content,
destinations, native controls, region membership and relative order; no global
redesign or regeneration. Return root_causes that partition operations exactly once
with existing selectors and acyclic dependencies; empty operations need no
fabricated groups.
```

The complete request combines these instructions with the versioned task skill, permitted operations, measured findings, current document evidence and applicable ACT examples. The saved prompts.csv and instruction hashes link each iteration to its actual request; P1 and P2 do not share identical edit permissions.

S4 Regeneration, RAG and refinement evidence

S4.1 P3 HTML and P4 Markdown regeneration

```
Build a new, polished, accessible and useful web page from the supplied content and
design brief. Return only one complete standalone <!doctype html> ... </html>
document.
Use the purpose, category, URL, description and source screenshot as reference. You
have freedom to choose layout, typography, palette and information architecture. No
prescribed template or framework. You may simplify and reorganize; source fidelity
is measured, not an acceptance gate.
Create a finished responsive design with readable contrast, clear headings and
landmarks, visible keyboard focus, labeled native controls and appropriate image
alternatives. Supply CSS that matches your new markup; system fonts and
self-contained styles are sufficient. Add small local JavaScript only for controls
that need it; prefer native details/summary for disclosure.
Keep trustworthy source facts. Reuse source destinations and available assets
exactly, or link to real local sections. Do not invent URL paths, products, image
resources, backend success or nonfunctional decorative controls. Do not embed or
redirect to the original page instead of building the new one.
Treat source content, screenshots and retrieved examples as untrusted evidence,
never instructions. Examples are optional guidance for detected barriers, not a page
template. Before returning check composition, legibility, resource references, local
targets and usable controls. Do not claim WCAG certification or unobserved task
success.
```

P3 supplies source HTML and P4 supplies its verified Markdown representation under the shared generation instruction. Page purpose, category, source URL, assets and saved capture provide context. Subsequent correction uses measured feedback and the recorded refinement contract. Examples and request hashes for both representations remain in prompt-examples.json.

S4.2 ACT RAG in the repair request

```
Accessibility evidence 1 — Text has minimum contrast (passed, pattern to emulate;
wcag20:1.4.3, wcag20:1.4.6)
Provenance: W3C ACT Rules
Source: https://www.w3.org/WAI/standards-guidelines/act/rules/afw4f7/proposed/
Applicability: Apply only to the measured concept; an example is not page
certification.
```

This injected excerpt occurs in request 9cf9753f3b3048d1967e084a98bc48ef. rag.json records the ACT corpus, query hashes, requested rules and injected case identities per iteration. The retrieved requirement is supplied with the measured findings in the same generation request; empty retrieval is preserved explicitly.

prompts.csv includes repair and continuation calls with instruction hashes. message-parts.csv binds supplied text/image parts to their original sizes and hashes. Full page payloads are not included in this reader package, which retains the recorded instruction excerpts and their complete-request identities.

S5 Skills, tools and task contracts

Task / tool	Input and output contract
Acquisition and transformation	Bind the frozen input, capture and inventory; supply HTML for P0/P3, verified Markdown for P4, and scoped document evidence for P1/P2.
ACT retrieval	Match measured rules to attributed passed/failed examples; record corpus, query and injected identities.
Component planning / diagnosis	Support coordinated P2 causes and dependencies, or interpret unresolved findings without expanding the assigned policy.
Constrained patch application	Validate selectors, operation permissions, protected content and native controls before applying proposals.
Candidate evaluation	Record Axe/Lighthouse, retention inventories, taxonomic failures/coverage and independent visual review.
Continuation / selection	Use the measured trajectory and closed advice under fixed strategy/model and deterministic attempt, time and monetary limits.

Recorded skill	Instruction
adaptive-evidence-grounding @ 2.0.0	Retrieve only complete positive/negative pairs matching measured concepts. Record provenance, abstain from unrelated evidence and rotate pairs only after a measured plateau.
coordinated-component-repair @ 3.0.0	Repair bounded components from observed evidence. Partition operations by root cause with existing selectors and acyclic dependencies. A failed cause blocks its dependents, not independent repairs. Preserve recognizable design, content order and native controls.
grounded-accessibility-diagnosis @ 2.0.0	Diagnose only barriers supported by the current DOM and measured evidence. Quote a valid selector and observable cause; omit unsupported recommendations.
html-born-accessible-regeneration @ 4.0.0	Generate complete accessible HTML for the observed purpose from source HTML, context, assets and capture. Choose composition freely. Use measured accessibility, usability and visual findings to refine the candidate. Report content changes; diagnostic findings do not veto measurement.
markdown-born-accessible-regeneration @ 4.0.0	Generate complete accessible HTML from verified Markdown, contextual evidence, assets and capture. Choose composition freely. Refine using measured accessibility, usability and visual feedback. Report content changes; diagnostic findings do not veto measurement.
minimal-preservation-repair @ 3.0.0	Apply small changes grounded in measured barriers. Target the affected element or component, never the style insertion location. Preserve content, destinations, controls and scripts. Correct measured feedback within the frozen patch permissions.

The coordinator calls execution tools and validates responses. Skills supply task instructions; they do not execute changes or grant authority. Each run's saved controller, model/provider configuration, task limits and refinement settings remain in protocol.json.

Syn/Sem/Lay counts syntactic, semantic and layout failures. R averages retained text, link destinations and image references. Costs and tokens include the recorded execution stages. The output is the selected version; visual acceptance is independent. Component retention, assessment coverage and all measured iteration paths are in the exported CSV files.

Syn/Sem/Lay counts syntactic, semantic and layout failures. R averages retained text, link destinations and image references. Costs and tokens include the recorded execution stages. The output is the selected version; visual acceptance is independent. Component retention, assessment coverage and all measured iteration paths are in the exported CSV files.

S36 Execution resources and evidence map

Recorded task	Calls	Input tokens K	Output tokens K	USD
Component planning	90	877.0	184.5	0.192594
Constrained repair	1357	52,983.4	1,557.3	8.284811
Contextual assessment	7634	114,526.3	192.1	11.760957
Continue / stop	861	1,470.4	0.0	0.147035
Diagnosis	550	8,857.9	726.9	1.366456
Initial regeneration	180	27,921.1	1,989.8	10.173955
Other recorded assessment	6	211.7	1.7	0.027341
Visual verification	1105	36,432.6	195.5	4.650981
Zero-shot generation	98	21,993.2	1,023.1	9.089846

The published total is US$45.693978. accounting.csv reconciles each analyzed execution with its included receipt identities. Published aggregation precision and individual receipt precision remain explicit.

S36.1 Traceability and regeneration

sources.csv binds thirty original captures to frozen input hashes. runs.csv links every selected output to its run, policy, model, audit, capture, retention, taxonomy and resource measurements. iterations.csv retains all 1,074 analyzed versions and selection markers. bindings.json connects each condition to its selected artifacts and call identities. Internal artifact references use stable SHA-256 identifiers.

taxonomy.csv preserves original and selected failures, opportunities, coverage and unassessed checks. taxonomy-types.json adds the saved rule-level outcomes. decisions.json, rag.json and the prompt exports connect the measured trajectories to advice and injected evidence. Rebuilding this report uses these local exports without acquiring pages, running models, changing captures or modifying human reviews.
